

Reduce inspected frames for attempt partitioning to every 1th frame
 Attempt zone is a capsule.
 I cut off experiments once all the points crossed through the slit
 Counted as attempt if any corner of the shape is found in the AttemptZone in given frame
 Median filter with window 6 s, when separating attempts
 Extended run by linear continuation in x direction until all the corners passed the finish line
 Mean of data points with standard deviation divided by $\sqrt{\text{data points}}$ (standard error of the mean)
